

Case Study: PK Foods Price Intelligence Dashboard

I built an end-to-end price intelligence system for Pakistan's food markets — consolidating records across 10 cities and 35 food items into a single Excel analytics framework, with a companion Python/CSV pipeline for teams that want to move beyond spreadsheets. The result: a dashboard that turns fragmented survey data into clear answers on where prices are highest, which categories carry the most volatility, and where revenue is concentrated.

What I delivered

- Structured data model with pivot tables, advanced charting, and conditional formatting in Excel
- A formula-driven KPI dashboard — revenue by city, price by category, volatility ranges, and Pareto revenue concentration — all recalculating live off the source data
- A CSV-to-XLSX pipeline demo: raw survey exports import into a clean data table that feeds every downstream chart and KPI card automatically, no manual re-linking needed
- Executive-ready reporting output (PDF) for stakeholders who don't want to open the spreadsheet

Snapshot results

Records analyzed	Cities covered	Categories tracked	Top finding
1,100	10	9	12% revenue share in top city

How I work

I specialize in taking messy, fragmented data — spreadsheets, CSV exports, survey dumps — and turning it into structured, automated reporting that decision-makers actually use. That includes data cleaning, ETL pipelines, SQL analysis (CTEs, window functions), and Excel dashboards, with AI tools used deliberately to speed up the work, not replace the judgment behind it.

Core skills

Python	SQL	Excel Dashboards	ETL Pipelines
Data Cleaning	Power Query	Automation	

Let's talk about your data. If you're sitting on spreadsheets, survey exports, or operational data that no one has time to turn into decisions — that's exactly what I do.
