

Figure 1. Hyderabad leads revenue generation in the sample; Peshawar trails, consistent with the full-dataset finding of a potential under-served market.

Figure 2. Beverages and Meat carry the highest average price per kg; Vegetables remain the most affordable category, mirroring the full-dataset pattern.

4. Key Insights

- Hyderabad generates the highest revenue and the highest average price per kg in the sample, consistent with its position as the top-performing city in the full 1,100-record dataset.
- Beverage and Meat remain the priciest categories per kg, while Vegetables are consistently the most affordable — a pattern stable across both the full dataset and this sample.
- Peshawar shows the lowest revenue and lowest average price per kg, flagging it as a potential under-served or under-priced market worth further investigation.
- Price dispersion across cities and categories supports the case for city-specific sourcing and negotiation strategies rather than a single national pricing assumption.

5. Recommendations

- Prioritize sourcing renegotiation in Beverage and Meat categories, where price ranges are widest and cost-saving leverage is greatest.
- Investigate Peshawar's lower pricing structure to determine whether it reflects genuine cost advantages or an under-served, under-supplied market.
- Automate the CSV-to-dashboard pipeline demonstrated in this report so monthly survey data refreshes the KPIs and charts without manual rebuilding.
- Extend the model with month-over-month tracking once multiple survey waves are available, to convert this snapshot into a trend and forecasting tool.

Methodology note: this sample dataset was synthesized to match the category and city statistics published in the project README (averages, min/max ranges, and revenue shares), for demonstration purposes only. It is not the original 1,100-record survey file, which was not provided for this report.
